Neonatal sepsis prevention in low-resource settings

Angela Dramowski
dramowski@sun.ac.za
 Department of Paediatrics and Child Health and
 Department of Global Health, Stellenbosch University, South Africa

Hosted by Paul Webber
 paul@webbertraining.com

www.webbertraining.com **November 22, 2018**

Background

- Global decline in under 5 childhood mortality rates
- BUT limited progress in neonatal mortality reduction
- Nearly 50% of under 5 deaths now occur in newborns

Severe bacterial infection affects:

- 7 million neonates
- 750 000 deaths
- >90% in LMIC

In South Africa, hospital-acquired infection is 2nd most prevalent avoidable factor in neonatal deaths.

Hosted by Paul Webber paul@webbertraining.com
 www.webbertraining.com

Neonatal Sepsis Prevention in Low-Resource Settings
Dr. Angela Dramowski, Stellenbosch University, South Africa
A Webber Training Teleclass

Outline

- Summarise the epidemiology of neonatal sepsis in low-middle income countries (LMIC)
- Discuss current and new strategies for neonatal sepsis prevention

Why are neonates vulnerable to HAI?

Immature immunity (innate, acquired, vaccine-derived)

Many invasive procedures

Prolonged length of stay

Exposure to broad-spectrum antibiotics

Rapidly colonised with antibiotic-resistant bacteria

Many caregivers, more handling, incontinence

Overcrowding, congregate settings

Also vulnerable to introduction of respiratory and gastrointestinal viruses, maternal TB exposures

Challenges to Neonatal IPC in Africa

Burden of endemic health-care-associated infection in developing countries: systematic review and meta-analysis

Benedetta Allegranzi, Sepideh Bagheri Nejad, Christophe Combescure, Wilco Graafmans, Homa Attar, Liam Donaldson, Didier Pittet

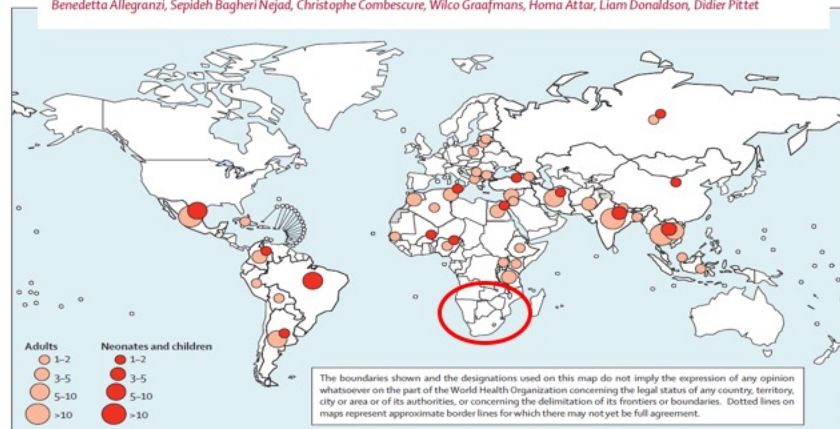

Figure 2: Number of studies reporting health-care-associated infection in developing countries, 1995-2008. Size of dots indicates number of studies. Map created with ARCVIEW (version 9.3.1; ESRI, Redlands, CA, USA), using WHO criteria for official borders and disputed borders.

Overall HAI in neonates 3 – 20 fold greater than high-income countries

Allegranzi Lancet 2011

6

Neonatal Sepsis Prevention in Low-Resource Settings
Dr. Angela Dramowski, Stellenbosch University, South Africa
A Webber Training Teleclass

Bloodstream infections are the predominant type of hospital-acquired infection (HAI) in neonates.

Prevention of HA-BSI should be the focus of neonatal IP programmes.

7

Risk factors for neonatal sepsis

	Risk factors
Early-onset sepsis	<ul style="list-style-type: none"> Known maternal GBS colonization Premature rupture of membranes Prolonged rupture of membranes > 18 h Maternal fever or chorioamnionitis Preterm delivery Multiple pregnancies
Late-onset sepsis	<ul style="list-style-type: none"> Traumatic delivery Disruption of intrinsic neonatal barriers (e.g. skin) Prolonged use of an indwelling intravascular catheter Invasive procedures (e.g. endotracheal intubation) Lack of enteral feeding with breast milk Prolonged use of antibiotics (particularly broad spectrum) Necrotising enterocolitis Premature or VLBW infants

**50-90% of
neonatal
BSI in LMIC**

Cailes Early Human Development 2015

8

Neonatal Sepsis Prevention in Low-Resource Settings
Dr. Angela Dramowski, Stellenbosch University, South Africa
A Webber Training Teleclass

Which organisms cause neonatal unit outbreaks?

• **Bacteria**

- *Klebsiella pneumoniae*, *E coli* (ESBL)
- *Acinetobacter baumannii*, *Pseudomonas aeruginosa*
- *Staphylococcus aureus* incl. MRSA
- Emerging pathogens: ***Serratia marcescens***

• **Viruses**

- Rotavirus, Norovirus
- RSV, parainfluenza, influenza

• **Fungi**

- mostly *Candida spp*

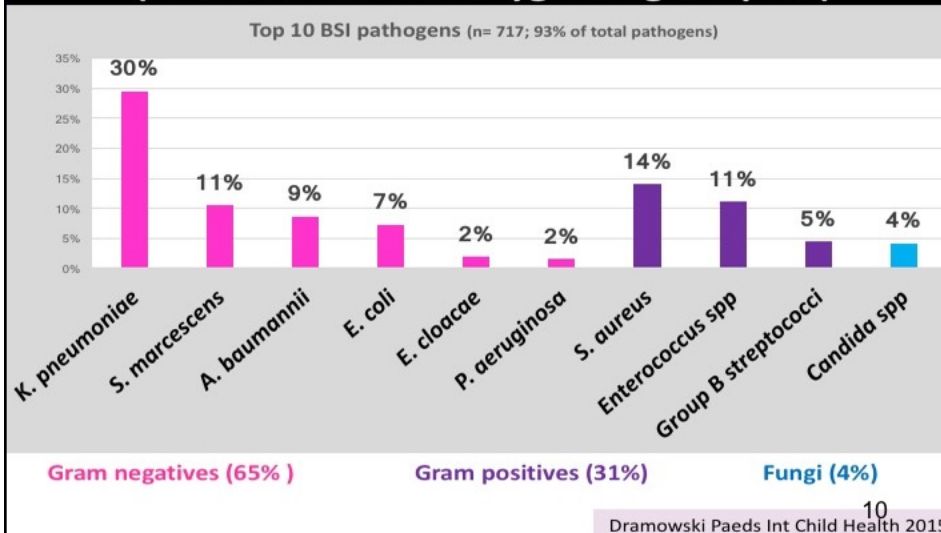

Occasionally: TB, HIV, Hepatitis B, PJP

Risk factors: low birth weight, broad spectrum antibiotics, central lines, TPN

9

Profile of neonatal sepsis pathogens in LMIC

**Gram negative pathogens predominate
 (neonatal HA-BSI at Tygerberg Hospital)**

Hosted by Paul Webber paul@webbertraining.com
 www.webbertraining.com

Neonatal Sepsis Prevention in Low-Resource Settings
Dr. Angela Dramowski, Stellenbosch University, South Africa
A Webber Training Teleclass

African neonatal HA-BSI rates

Neonatal HA-BSI:

Maoulainine	(Morocco)	18 / 1000 PD*
Gadallah	(Egypt)	14 / 1000 PD
Ballot	(S. Africa)	14/ 1000 PD
Spicer	(S. Africa)	7 / 1000 PD
Dramowski	(S. Africa)	4 / 1000 PD

Mortality varies by study 20 – >70%

*PD = patient days

11

**Principles of neonatal sepsis prevention:
 targets for intervention in hospital settings**

Promote colonisation with normal flora	Prevent colonisation with pathogens	Maintain skin integrity
Exclusive breastfeeding	Hand hygiene	Avoid/reduce adhesive use
Kangaroo mother care	Environmental cleaning	Avoid skin breaches (oral therapy, IV access, blood draws, non-invasive tests)
Reduce antibiotic use	Avoid shared equipment	?Emollients
Pre and Probiotics	Avoid re-use of devices	?Zinc
	Skin antiseptics: chlorhexidine

Reprocessing of single use medical devices

Common practice in Africa:
 Recycling/re-use of single use items
 Lack of training in decontamination & sterilization

Potential for outbreaks
 e.g. *Serratia marcescens* in NICU
 source = reprocessed (disposable) ventilator tubing

Challenges in Africa:
 Can re-use ever be safe?
 Ageing infrastructure
 All staff need training in disinfection & cleaning

SINGLE USE ONLY

17

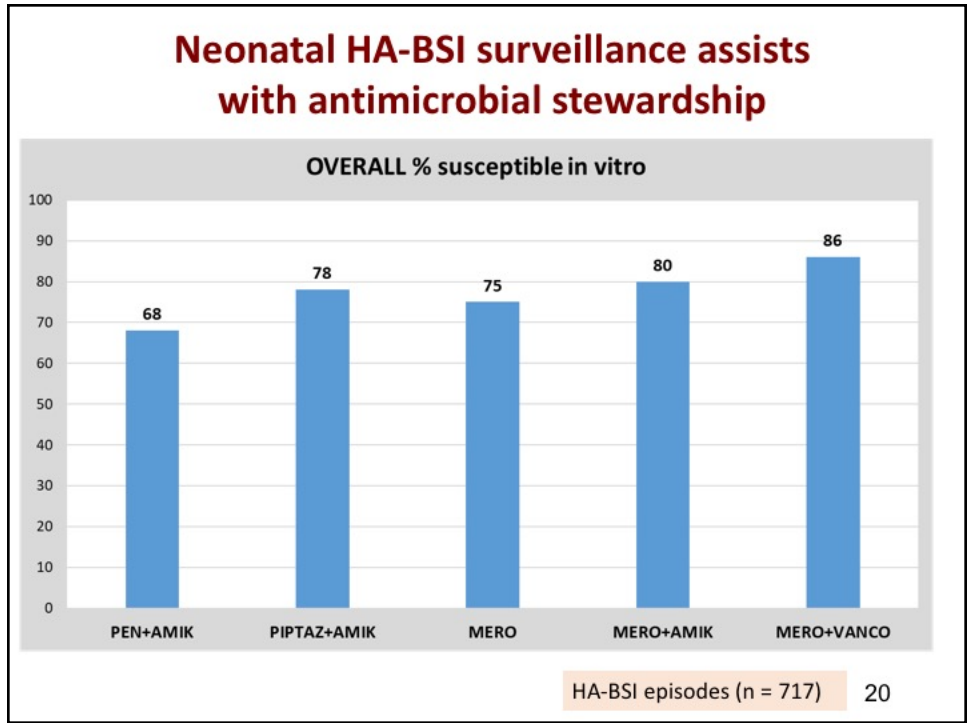

Improved neonatal HA-BSI surveillance & outbreak detection with weekly feedback

Bloodstream Infections on the Neonatal Platform					
Patient	Date of Specimen	Microbe	Ward related to infection	Type of infection	Isolation Precautions
	30/05/2017	<i>Serratia marcescens</i> IBL	J3	BSI	Contact
	27/05/2017	<i>Enterococcus faecalis</i> ; <i>Enterococcus faecium</i>	A9 NICU	BSI	Contact
	29/05/2017	MRSA	G2	BSI	Contact
	25/05/2017	MRSA	G2	BSI	Contact
	23/05/2017	MRSA	G1	BSI	Contact
	20/05/2017	<i>Klebsiella pneumoniae</i> (CRE); MRSA	G1/A9 NICU	CLASI	Contact

Dr. Angela Dramowski, Stellenbosch University, South Africa
A Webber Training Teleclass

Syndromic isolation: proactive vs reactive

Empiric use of transmission-based precautions on first signs/symptoms of infection
e.g. rash for HSV, loose stools for rotavirus, RDS for RSV

Take appropriate specimens and de-isolate if negative

Assumes a sufficient number of isolation beds and staffing

21

Core elements of a neonatal IPC programme

Surveillance of device-associated infections PICU/NICU

Patrick Pediatrics 2014

Rates of CLABSI and VAP in NICUs, January 2007 to September 2012. CLABSI: 2615 events; 5 026 125 patient days; 1 222 366 line days.

FIGURE 1. Evolution of central line-associated bloodstream infection rates in each neonatal intensive care unit (NICU).

Rosenthal ICHE 2013 23

CLABSI bundle programme: a recipe for success

24

Neonatal Sepsis Prevention in Low-Resource Settings
Dr. Angela Dramowski, Stellenbosch University, South Africa
A Webber Training Teleclass

Tygerberg Hospital: CLABSI programmes

First public sector NICU CLABSI programme (2012)

First public sector neonatal ward CLABSI bundle (2017)

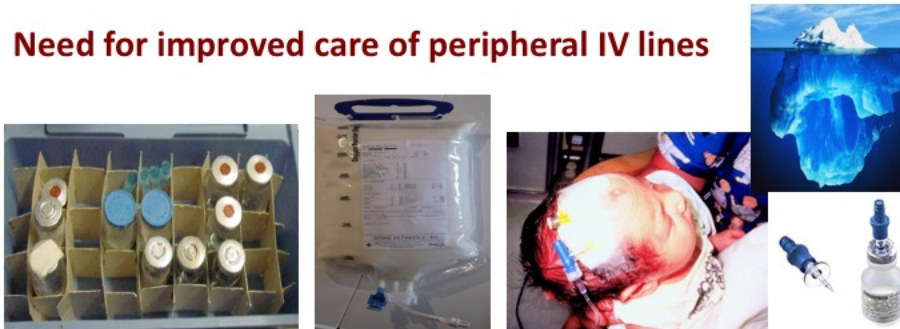

Driven largely by one neonatal and one IPC nurse practitioner

Supported by Paeds ID service and Neonatal Consultant

25

Need for improved care of peripheral IV lines

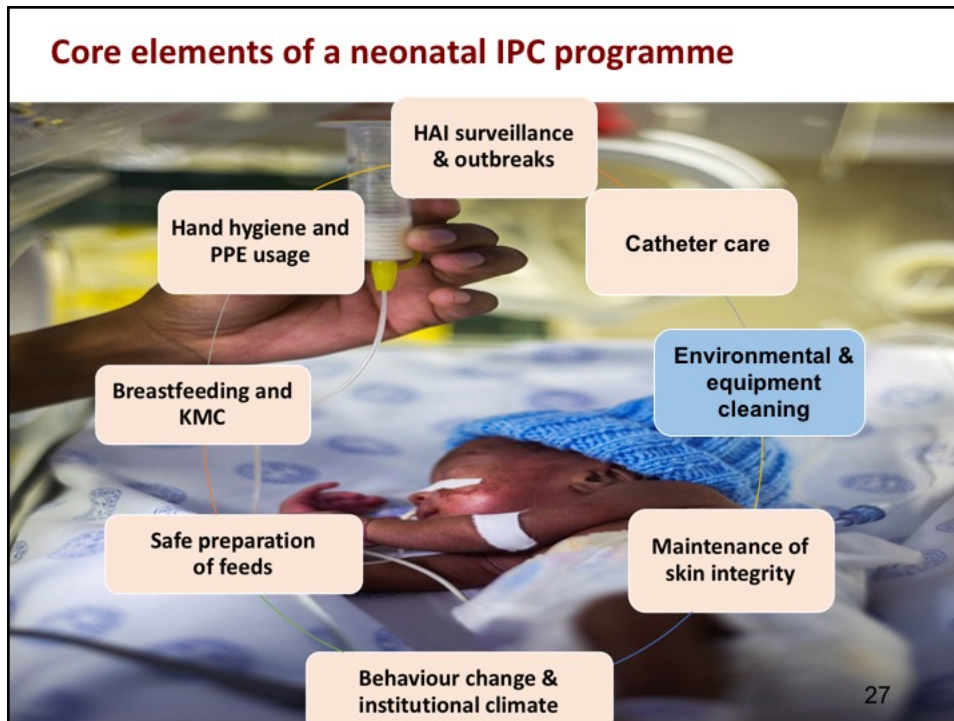

- Poor line care (central and peripheral)
- Multi-dose vials with limited use of claves
- Very limited implementation of catheter bundles
- High rates of needlestick injury

26

Environmental cleaning contributes to safer care

Table 1: Persistence of clinically relevant bacteria on dry inanimate surfaces.

Type of bacterium	Duration of persistence (range)
<i>Acinetobacter</i> spp.	3 days to 5 months
<i>Bordetella pertussis</i>	3 – 5 days
<i>Campylobacter jejuni</i>	up to 6 days
<i>Clostridium difficile</i> (spores)	5 months
<i>Chlamydia pneumoniae</i> , <i>C. trachomatis</i>	≤ 30 hours
<i>Chlamydia psittaci</i>	15 days
<i>Corynebacterium diphtheriae</i>	7 days – 6 months
<i>Corynebacterium pseudotuberculosis</i>	1–8 days
<i>Escherichia coli</i>	1.5 hours – 16 months
<i>Enterococcus</i> spp. including VRE and VSE	5 days – 4 months
<i>Haemophilus influenzae</i>	12 days
<i>Helicobacter pylori</i>	≤ 90 minutes
<i>Klebsiella</i> spp.	2 hours to > 30 months
<i>Listeria</i> spp.	1 day – months
<i>Mycobacterium bovis</i>	> 2 months
<i>Mycobacterium tuberculosis</i>	1 day – 4 months
<i>Neisseria gonorrhoeae</i>	1 – 3 days
<i>Proteus vulgaris</i>	1 – 2 days
<i>Pseudomonas aeruginosa</i>	6 hours – 16 months; on dry floor: 5 weeks
<i>Salmonella typhi</i>	6 hours – 4 weeks
<i>Salmonella typhimurium</i>	10 days – 4.2 years
<i>Salmonella</i> spp.	1 day
<i>Serratia marcescens</i>	3 days – 2 months; on dry floor: 5 weeks
<i>Shigella</i> spp.	2 days – 5 months
<i>Staphylococcus aureus</i> , including MRSA	7 days – 7 months
<i>Streptococcus pneumoniae</i>	1 – 20 days
<i>Streptococcus pyogenes</i>	3 days – 6.5 months
<i>Vibrio cholerae</i>	1 – 7 days

Improvements in management of
EBM and EBM containers / utensils

37

Infant feeds as a risk factor for HAI

Totaal BOTTEL/BEKER voedings in Neonatale Sale:
01 Jan - 31 Maart 2015: 24,463.
ALLE donormelkvoedings is Uitgesluit.

Lack of standardized protocols & training
Ageing and poorly maintained equipment
Regular EBM exposures: non-maternal HIV

38

Kangaroo Mother Care for infection prevention

Increased breastfeeding
Increased colonization by maternal flora
Less invasive procedures
Improved growth
Enhanced skin barrier function
Earlier hospital discharge

Reduced nosocomial infection rate and severity

NB. Screening of mothers on neonatal wards for pulmonary TB

Conde-Agudelo. Cochrane Database Syst Rev. 2014.

Personal protective equipment

Contact Precautions

VISITORS: VISITING STAFF

STOP!

REPORT TO NURSE IN CHARGE BEFORE ENTERING THIS ROOM

- HAND:** Use alcohol rub or wash hands before leaving the room.
- Aprons/Gloves:** Wear an apron when entering the room. Wear gloves for direct or indirect contact with the patient or equipment and surfaces.
- Door:** Keep door closed at all times if patient is isolated.
- Before leaving:** Decontaminate equipment when it leaves the room. Discard gloves and aprons and carry out hand hygiene before leaving the room.

Airborne Precautions

VISITORS: VISITING STAFF

STOP!

REPORT TO NURSE IN CHARGE BEFORE ENTERING THIS ROOM

INSTRUCTION BEFORE ENTERING THE ROOM

- HAND:** Use alcohol rub or wash hands before leaving the room.
- Respirator:** Wear N95 respirator (FFP2) or MDRO, ACR-TB patients, particulates.
- Aprons/Gloves:** Wear an apron when entering the room. Wear gloves for direct or indirect contact with the patient or equipment and surfaces.
- Door:** Keep door closed at all times.
- Before leaving:** Decontaminate equipment when it leaves the room. Discard gloves, apron and mask. Carry out hand hygiene before leaving the room.

Droplet Precautions

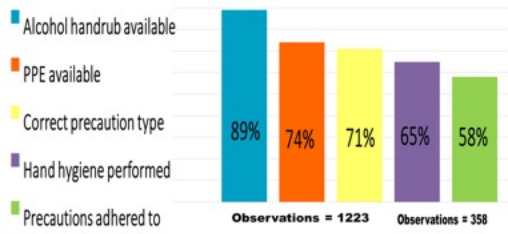

VISITORS: VISITING STAFF

STOP!

REPORT TO NURSE IN CHARGE BEFORE ENTERING THIS ROOM

INSTRUCTION BEFORE ENTERING THE ROOM

- HAND:** Use alcohol rub or wash hands before leaving the room.
- Mask:** Wear water-resistant mask that covers the nose and mouth of the patient.
- Aprons/Gloves:** Wear an apron when entering the room. Wear gloves for direct or indirect contact with the patient or equipment and surfaces.
- Door:** Keep door closed at all times if patient is isolated.
- Before leaving:** Decontaminate equipment when it leaves the room. Discard gloves, apron and mask. Carry out hand hygiene before leaving the room.

Measure	Percentage
Alcohol handrub available	89%
PPE available	74%
Correct precaution type	71%
Hand hygiene performed	65%
Precautions adhered to	58%

Observations = 1223 Observations = 358

Dramowski ARIC 2015 43

Core elements of a neonatal IPC programme

- HAI surveillance & outbreaks
- Catheter care
- Environmental & equipment cleaning
- Maintenance of skin integrity
- Behaviour change & institutional climate
- Safe preparation of feeds
- Breastfeeding and KMC
- Hand hygiene and PPE usage

44

Risk factors for HAI in Africa: weak health systems

Infectious disease burden

Human resources for health

- Weak or non-existent IC programs
- Severe shortage of IC practitioners
- Lack of patient safety culture / awareness of HAI
- No requirement for surveillance & reporting of HAI

www.worldmapper.org

49

Neonatal staff as a potential source of infection

- Minimal training in IC (undergraduate & in-service)
- Limited knowledge of HAI and IPC principles
- Understaffing, high turnover, use of agency staff
- Additional functions eg portering, cleaning
- Presenteeism
- Minimal uptake of available vaccinations
- Lack of accountability and IC champions
